

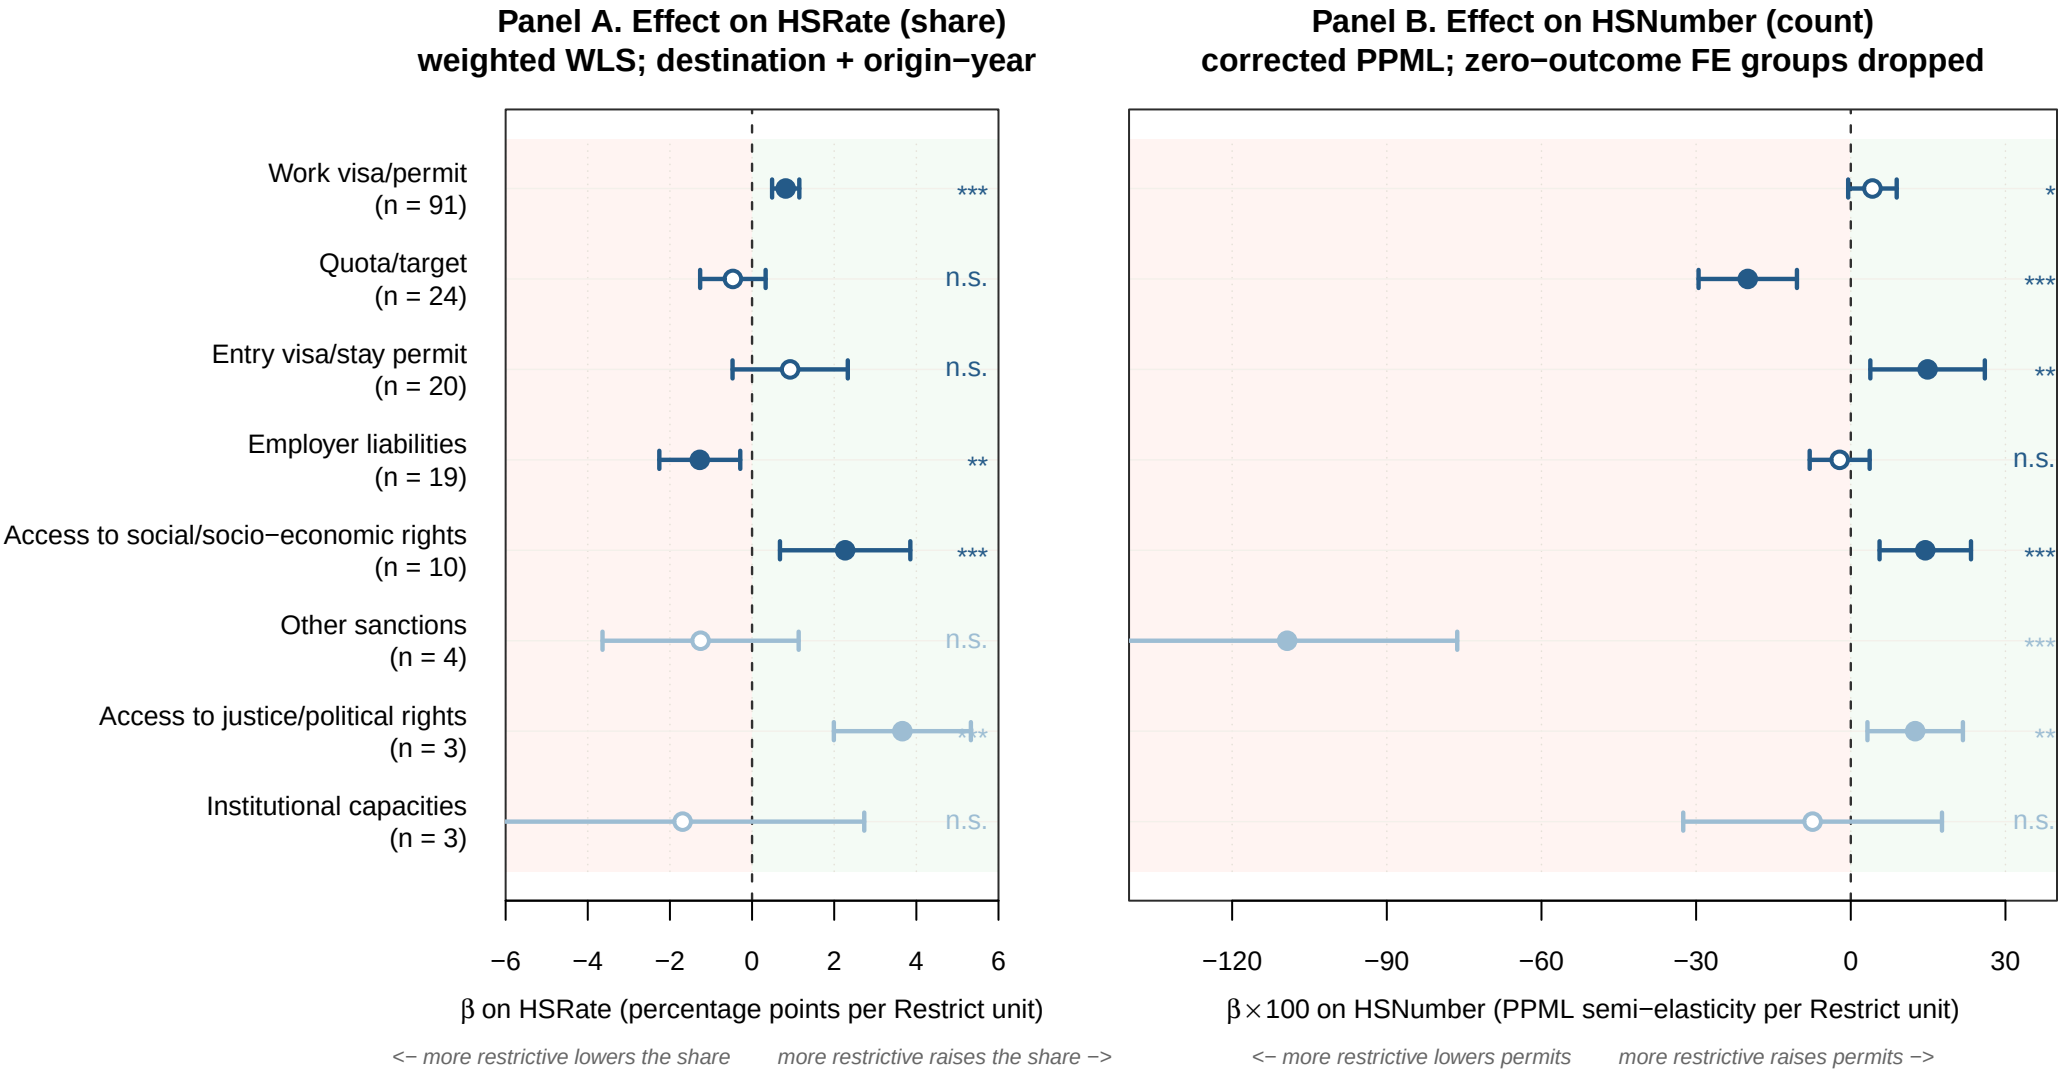

Graph 4. Tool-specific estimates for DEMIG-QuantMig tools with at least three retained events

Dark blue: $n \geq 10$ events; light blue: $n = 3-9$ events (small-N, indicative only). Filled dot: $p < 0.05$; open dot: $p \geq 0.05$. Stars: *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Each row is a separate regression using tool-specific Restrict_lag1 and controlling for high-/low-skilled target-group policy paths. Bars are 95% cluster-robust CIs. Panel A: $N = 5,608$, $G = 30$; Panel B corrected PPML: $N = 5,219$, $G = 27$.

Panel B reports beta x 100 semi-elasticities, not exact $\exp(\beta) - 1$ percentage changes; all-zero fixed-effect groups are dropped before PPML estimation.
